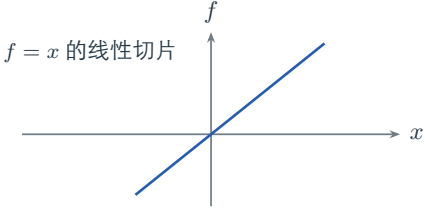
M1-15 标量随位置变化时，求导必须分配两次



$$\nabla f = \mathbf{e}_x,\ \nabla \cdot \mathbf{A} = 0$$

$$\nabla \cdot (f\mathbf{A}) = 0 + \mathbf{A} \cdot \mathbf{e}_x = y$$

$$\begin{aligned} &\nabla \times (f\mathbf{A}) \\ &= x(-1,-1,-1) + (0,-x,z) \\ &= (-x,-2x,z-x) \end{aligned}$$

下排表示数量乘法关系，箭头不表示场的流向
