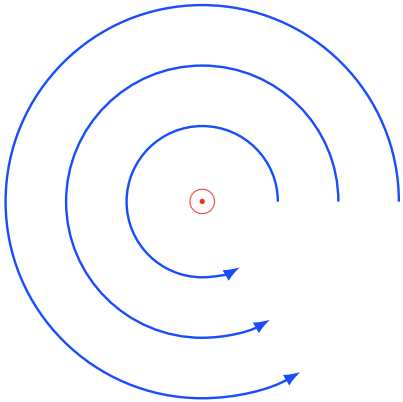
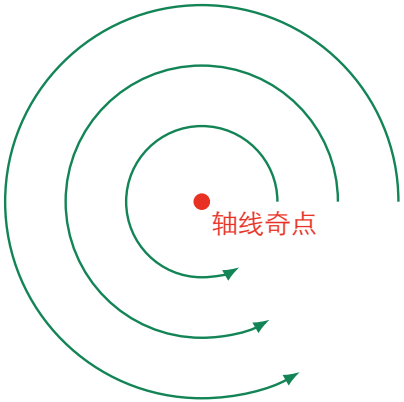
例：刚体旋转处处有旋，势涡的旋度集中在奇点

$\nabla \times \mathsf{v} = 2\boldsymbol{\Omega}$（指向纸外）



$\mathsf{v} = \boldsymbol{\Omega} \times \mathsf{r}$



$\mathsf{v} = \Gamma(2\pi r)^{-1}\mathsf{e}_\phi$

$r > 0$ 处旋度为零，但环量为 Γ
