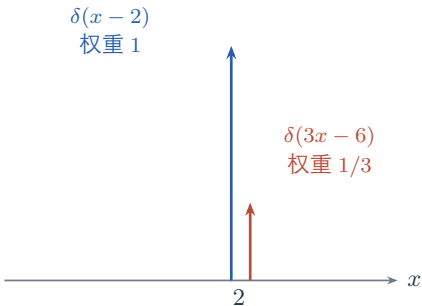
例：变量缩放改变 δ 的权重



为便于比较，两箭头略微横向错开

$$3x - 6 = 3(x - 2)$$

$$\delta(3x - 6) = \tfrac{1}{3}\delta(x - 2)$$

$$\int f(x)\delta(3x - 6)\,dx = \frac{f(2)}{3}$$

缩放的是权重，支撑点仍为 $x = 2$。
