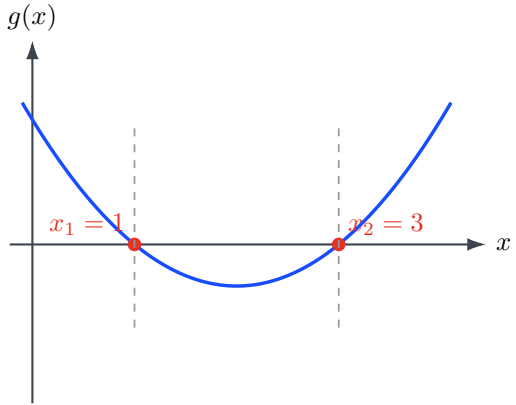
复合 δ：每个单根都贡献，权重由局部斜率决定



$g(x) = (x-1)(x-3)$

$$|g'(1)| = |g'(3)| = 2$$

$$\delta(g) = \frac{1}{2}\delta(x-1) + \frac{1}{2}\delta(x-3)$$

$$I = 5 + \frac{1}{2}(\sin 1 + \sin 3)$$

漏掉任一根都会漏掉一项贡献。
