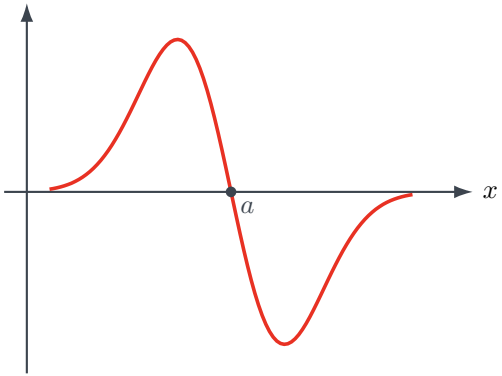
δ' 读取测试函数的负斜率，而不是函数值

$\delta'_\varepsilon(x-a)$ 的正则化示意



$$\int f(x)\delta'(x-a)\,dx = -f'(a)$$

$$f = x^2 + \sin x \Rightarrow I(a) = -(2a + \cos a)$$

$$\langle x\delta', f\rangle = -(xf)'|_0 = -f(0)$$

故 $x\delta'(x) = -\delta(x)$。
