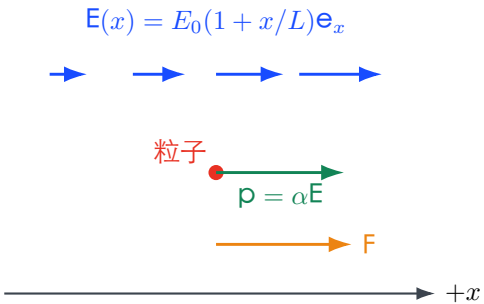
线性感应偶极：极化能含二分之一，粒子趋向强场区



$\alpha > 0, L > 0$：力指向强场侧

$$U = -\int_0^E \alpha E'\, dE' = -\frac{1}{2}\alpha E^2$$

$$\mathsf{F} = -\nabla U = \frac{1}{2}\alpha \nabla E^2$$

$$E(x) = E_0(1 + x/L) \Rightarrow F_x(0) = \alpha E_0^2 / L$$
